

What is Senaryon?

Senaryon is a platform for the development and implementation of digital learning modules, in particular online simulation games. The game interface consists of a custom avatar, team chats, information, voting tools as well as a phase and task system. Senaryon is browser-based and can be used on a computer, tablet or smartphone anytime and anywhere, provided the device is online.

Senaryon is used at numerous universities, schools and extracurricular educational institutions at home and abroad and has been awarded international prizes, including the PeaceApp-Award of the United Nations PeaceApp Award and the Games4Change Award.

Usage models of Senaryon

1 40 games already on offer

We have already added 40 different games on Senaryon on all our main topics (European politics, international politics, climate and sustainability, democracy & society), which we can run on request without any further adjustments.

2 New simulation game on Senaryon

We can convert many of our more than [100 analogue games](#) into a digital implementation. Of course, we can also design and implement a new online simulation game according to your ideas.

3 Independent online implementation

Are you interested in implementing one of our online planning games yourself?

No problem – we offer online training to prepare you for independent implementation. Via the integrated task system, you can also use the participants' achievements – such as researching their own role profiles, press statements or a reflection essay.

4 Joint conception – independent implementation and adaptation

We will not only train you in the independent implementation of the simulation game. You can also get access to Senaryon's Content Management System (CMS) and update the existing simulation or add new topics yourself. We offer support in the creation of the game template and provide didactic advice as well as technical support.

5 Senaryon as a virtual think tank

You would like to develop new ideas with a group, but you are not necessarily in the same place? Then use Senaryon as a platform for the collaborative development, negotiation and coordination of ideas or demands.

i Online or hybrid – both are possible!

All the models mentioned are suitable for purely online and hybrid implementation. In the online version, the participants are not in the same place, but take part in the game from home via an internet-capable device. The simulation is then conducted via Senaryon in combination with a video conferencing software. In the case of so-called hybrid games, participants and trainers are on site. The content of the game – scenario, background information and role profiles - are provided digitally („paperless simulation“). The participants are guided step by step through the simulation game by the software. Interaction takes place via face-to-face communication and additional digital elements, e.g. preparatory tasks, voting or countdowns.
